

Class Exercise 3: APA Writing Style

Description: APA (American Psychology Association) formatting is the standard writing style used for most scientific psychological papers published. In this class, it is important that we understand the *why* behind why APA formatting is used as a common language to disseminate findings, and how accessibility is important for both the writer and reader of APA papers. You will never need to memorize APA “rules”; rather we will have numerous opportunities in this course to practice APA writing style. The purpose of this homework is to identify and correct APA errors so that you do not commit them in your writing.

Instructions: **View** the APA resources provided on Canvas by your instructor.

Revise the following pages by identifying and fixing errors in APA formatting within the writing, including APA mechanics (e.g., numeral expression) and appropriate language (e.g., inclusive language).

Requirements: To successfully complete this exercise, you are required to:

1. **Edit** your changes directly within the document and/or by creating a comment for each change necessary
 - o turn on “track changes” for markups in your word document (for Word: click “Review” -> “Tracking” -> Track Change “On”; for Pages: click “Edit” -> “Track changes”)
 - o please revise by making changes to each of the sections of the class exercise
2. **Organize** (e.g., alphabetize) and **fix** APA errors within the example Reference page

Please use a **Word** to complete this exercise (as well as all class exercises and assignments).

- - - - -

Section 1: Introduction paragraph

Please revise this Introduction paragraph by editing the appropriate citations and first-person language. Note that one sentence is written in a passive voice.

As defined by Shaywitz ~~and~~ Shaywitz ~~in~~ (2005), reading disorder (RD, also known as developmental dyslexia or reading disability) is a developmental disorder typically associated with phonological processing difficulty and impaired development of fluent reading. Researchers ~~I've~~ found that quantitative meta-analyses of neuroimaging studies comparing RD and typical readers have identified decreased task-related blood oxygen level dependent (BOLD) signal in occipito-temporal and temporo-parietal brain regions within RD (Linkersdörfer ~~et al.~~, ~~Lonemann, Lindberg, Hasslehor, Fiebach~~ 2012; Maisog et al., 2008; Richlan et al., 2009), consistent with the role of these regions in phonological (Vigneau et al., 2006) and orthographic processing (e.g., Cohen ~~& and~~ Dehaene, 2004; Price ~~and~~ Devlin, 2011). Temporo-parietal reductions in grey matter volume in RD adults (Richlan et al., 2013) and in at-risk pre-readers (Black et al., 2012; Raschle et al., 2011) along with evidence that candidate RD alleles modulate cortical morphology and activation in left temporo-parietal (Meda et al., 2008; Pinel et al., 2012) and occipito-temporal regions (Cope et al., 2012; Meda et al., 2008) suggest that the primary neurodevelopmental origin of RD lies in posterior brain systems. While most studies thus far have focused primarily on dysfunction in temporo-parietal and occipito-temporal regions, meta analyses supports increased activation in RD relative to controls ~~is also supported by meta-analyses~~, including the bilateral striatum (including caudate and putamen) and globus pallidus, thalamus, left inferior frontal gyrus (IFG), left insula and left pre-central gyrus (Maisog et al., 2008; Richlan et al., 2009, 2011). Richlan's (2009) meta-review suggests that the fronto-striatal hyperactivation patterns seen in RD have often been interpreted as reflecting compensation engaged to reduce the impact of a primary phonological processing deficits arising from the temporo-parietal region ~~(Richlan et al., 2009)~~ although ~~I think that~~ the cognitive and neurobiological mechanisms that could lead to compensation are poorly understood.

Section 2: Methods paragraph

Please edit the following Method section for appropriate language and APA numeral expression.

Method

Participants

~~Fifteen~~ 15 German-speaking ~~adolescents with dyslexia~~ ~~dyslexic adolescents~~ ($M_{\text{Age}} = 17.31$, $SD_{\text{Age}} = 2.52$) and 14 age-matched ~~normal~~ readers without dyslexia ($M_{\text{Age}} = 17.82$, $SD_{\text{Age}} = 2.25$) participated in the present study. Due to technical problems and image artifacts, resting-state scans are not available for ~~three~~ 3 nonimpaired participants. For ~~one~~ 1 individual with dyslexia, we excluded the data for the phonological lexical decision task from our analysis, because head movements were too severe for a correction (i.e., 140 of 146 scans were affected in one session). All participants were male, right-handed, and had normal or corrected-to-normal vision. ~~I got~~ The study ~~was to be~~ approved by the ethics committee of the University of Salzburg (Ethikkommission der Universität Salzburg). Participants gave written informed consent and were paid for their participation.

Section 3: Individual Sentences

Please edit the following isolated sentences for appropriate **transitional adverb** usage and conciseness.

- [a] Participants in the testing condition displayed no long-term memory enhancement.
However, Participants in the restudy condition showed greater long-term memory, in direction opposition of findings for the participants in the testing condition.
- [b] ~~We would also like to add that~~ Moreover, there is substantial evidence of greater frontal lobe activation during emotional stimulation.
- [c] These participants were excluded because ~~since~~ they did not complete the entire survey.
- [d] Therefore, ~~if~~ we do not see any evidence of memory loss for patients with a reading disorder, we can conclude that we need ~~ing~~ more work in this particular area of research.

Section 4: Reference List

Please edit the following reference list by organizing across the citations according to alphabetical and chronological order. In addition, please fix any APA errors within the individual citations (e.g., italicization of journal title). *This is a separate list from the Intro and Method above, so focus on editing this reference list and not whether it matches the references in the sections above.
