

Class Exercise 16

1) What is one thing you learned about writing the discussion section this week?

I learned that there is no statistics used in the discussion section, but it makes sense since that is all included in the results. I also learned that we have to use a new reference in this section which I was not expecting.

2) What is something you learned from the new study you are citing in your discussion section (e.g., about the relationship between variables or something related to their method)?

I learned that the method of increasing intellectual humility that we learned about earlier in the semester (the three-science related multiple choice questions) worked as a successful manipulation.

3) Summarize the study you read using a narrative in-text citation (e.g., “Smith and Jones (2020) found...”). In your response, briefly describe: What the researchers tested, how they tested it, what they found (key results)

Koetke et al. (2023) tested whether investigative behavior can be predicted by intellectual humility and if intellectual humility can be increased by using a fallibility salience test. Investigative behavior was tested by having participants take an investigative behavior measure. Increasing intellectual humility was tested by using deception. Researchers had the participants complete the fallibility salience test, but they thought they were completing separate questionnaires. They found a statistically significant association between investigative behavior and intellectual humility, and also found that their manipulation did in fact increase intellectual humility. This increase in intellectual humility led to an indirect effect on the participants investigative behaviors.
